

THE WORLD OF NUCLEAR

STIGMATIZED

Nuclear energy has been haunted by tragedies of the past.

Nuclear energy

is a highly efficient, low-carbon power source created by splitting heavy atom to generate immense heat and electricity. Past tragedies have ruined the reputation for generations. Today, modern reactors have advanced technology has evolved to a point where the catastrophic meltdowns of the past are practically impossible.

CAPACITY FACTOR

Capacity factor measures how often a power plant runs at maximum power over a year.

Nuclear energy

currently provides roughly 9% of the world's electricity, yet it stands as the most consistently reliable energy source we have. Operating at an unmatched 92% capacity factor in the United States, nuclear plants run at maximum power nearly 24/7.

Nuclear energy

avoids

476

million metric
tons of CO₂

This is equivalent to
removing 100 million
cars off the road

Chemistry students account for a very minor fraction of the total student body. Having 50 students across all years.

● Chemistry ● Chemical Engineering
● Liberal Arts & Social Sciences
● Civil Engineering

Despite the relatively low amount of students. Chemistry thesis papers published under AdDU have among the most citations per paper (~42), showing the quality of their education in terms of how impactful their research papers are
